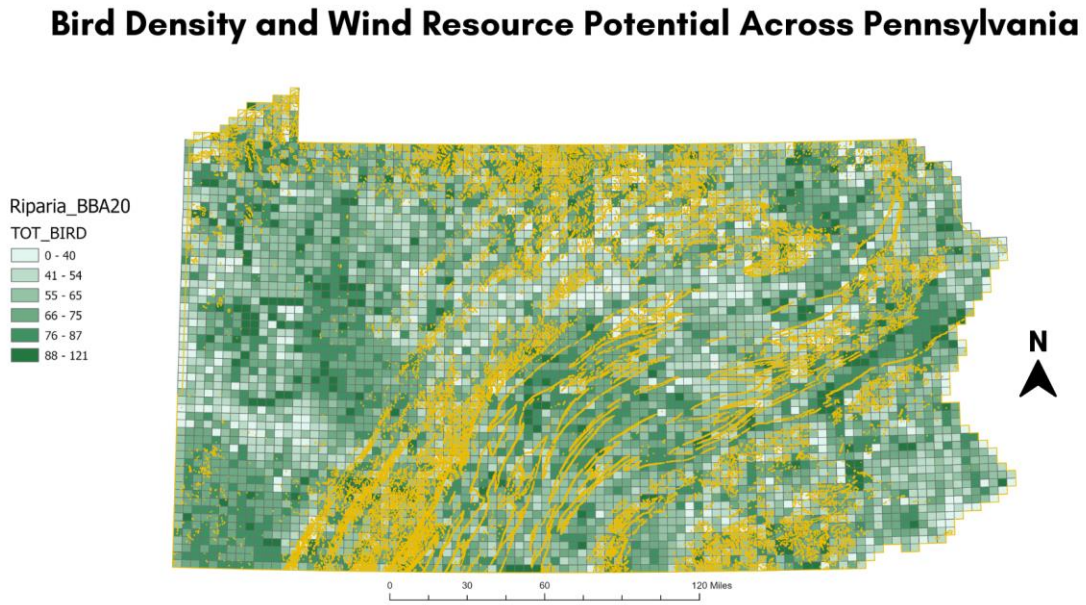
SCI-320: Bird Density and Wind Resource Potential Across Pennsylvania



This map displays the spatial distribution of total bird observations from the Pennsylvania Breeding Bird Atlas (2011 Riparian dataset) alongside modeled wind resource potential across Pennsylvania. Bird observations are represented using graduated colors based on the total number of birds recorded within each riparian mapping unit, while wind resource potential is shown as an orange overlay to illustrate areas with stronger wind energy potential. The datasets used in this map were obtained from the Pennsylvania Spatial Data Access (PASDA) clearinghouse.

I created this map with the purpose of visually comparing bird occurrence patterns with regions that may be suitable for wind energy development. Such comparisons can help identify areas where wind turbine placement may require additional ecological consideration in order to minimize potential impacts on bird populations and sensitive habitats.
